Limited Warranty

Nanomotion Ltd. (hereinafter NM) warrants the product (other than software) manufactured by it to be free from defects in material and workmanship for a period of time of one year (except those parts normally considered as consumable/expendable components such as motor conditioning brushes). The warranty commences thirty (30) days from the date of shipment.

NM warrants those parts replaced under warranty for a period equal to the remaining warranty coverage of the original part.

NM's sole and exclusive obligation under this warranty provision shall be to repair, or at its sole option exchange defective products or the relevant part or component, but only if: (i) the Purchaser reports the defect to NM in writing and provides a description of the defective product and complete information about the manner of its discovery within ten (10) days of its discovery; (ii) NM has the opportunity to investigate the reported defect and determines that the defect arises from faulty material, parts or workmanship; and (iii) the Purchaser returns the affected product to a location designated by NM. These provisions constitute the exclusive remedy of the Purchaser for product defects or any other claim of liability in connection with the purchase or use of NM products.

This warranty policy applies only to NM products purchased directly from NM or from an authorized NM distributor or representative.

This warranty shall not apply to (i) products repaired or altered by anyone other than those authorized by NM; (ii) products subjected to negligence, accidents or damage by circumstances beyond NM control; (iii) product subjected to improper operation or maintenance (i.e. operation not in accordance with NM Installation Manuals and/or instructions) or for use other than the original purpose for which the product was designed to be used.

NM shall not in any event have obligations or liabilities to the Purchaser or any other party for loss of profits, loss of use or incidental, increased cost of operation or delays in operation, special or consequential damages, whether based on contract, tort (including negligence), strict liability, or any other theory or form of action, even if NM has been advised of the possibility thereof, arising out of or in connection with the manufacture, sale, delivery, use, repair or performance of the NM products. Without limiting the generality of the preceding sentence, NM shall not be liable to the Purchaser for personal injury or property damages.
Patent Information

CE Compliance

This product has been tested for Electric Safety and Electromagnetic Compatibility inside a closed shielded metal cabinet and was found to be in compliance with the following directives and standards:

EMC Directive 89/336/EEC

FCC 47 CFR part 15 subpart B.

LVD directive 73/23/EC, Article 5

FCC 47 CFR: 2002 part 15, subpart B, class A

1 AB1A-3U Description

1.1 General

The AB1A-3U is a single-axis motor driver designed to drive up to 32 motor elements in parallel. The motor types that can be driven by AB1A-3U are HR, LS, ST and STM.

1.2 Main Features

- High precision (11 bits) control of the power output stage
- Drives up to 32 Nanomotion motor elements in parallel
- Interfaces with an Analog command
- Discrete inputs enable feedback from external sources, such as limit switches, emergency stop command, etc.
- LED indicators
- Output short circuit protection
- Reduced sensitivity to cable length and capacity
1.3 Operating Principles

The AB1A-3U Driver comprises the AB1A-3U main card and an LC card. The AB1A-3U Card converts the analog input command signal into a corresponding PWM square wave output signal that is fed to the LC Card. The LC Card produces the sine wave output voltage that drives the motor.

The LC Card type and configuration depends on the number of motor elements driven.

- For 1 to 16 elements, the LC circuit is internal to the AB1A-3U
- For 32 elements, the LC circuit is external to the AB1A-3U (LC Box)

An internal DC-to-DC converter that is fed from an external +48V power supply supplies the required DC voltages.

Figure 1 illustrates a typical application of the AB1A-3U Driver.

![Figure 1: AB1A-3U Block Diagram](image-url)
The motor has three terminals: “UP” (red wire), “DOWN” (white wire) and “COMMON” (black wire). The voltage applied between the “UP” and the “COMMON” terminals causes the motor to move in one direction, while voltage applied between the “DOWN” and the “COMMON” terminals causes the motor to move in the opposite direction.

Figure 2 is a schematic drawing of the power output.

### 1.4 Operation Modes

The AB1A-3U can be operated in one of the following operation modes:

- **Velocity Mode**, in which the motor is driven continuously.
- **Gate Mode**, in which the motor is driven at low velocity by turning the driver output ON and OFF in time intervals defined by outside TTL signal in an open loop.
- **Step Mode**, in which the driver output is turned OFF and ON at predefined intervals, in order to drive the motor in discrete steps.
1.4.1 Velocity Mode Operation

In this operation mode, the motor is driven continuously by applying the analog command voltage (± 10 V) using a relevant interface device (joystick or motion controller).

1.4.2 Step Mode Operation

In this operation mode the motor is turned on and off for fixed time intervals defined in the hardware as follows:

- ON phase - 1/16 second
- OFF phase - 0.5 second

The amplitude of the output corresponds to the analog input value and thus determines the speed of the motor.

1.4.2.1 Enabling the Step Mode

In order to enable the Step Mode, the B10 pin (see Table 7) should be shorted to the ground. By default, neither B10 nor Z14 (see section 1.4.3.1) is shorted to the ground, so that the user can select the required connection.

1.4.3 Gate Mode Operation

In this operation mode the motor is driven in open loop at low velocities by turning the driver output ON and OFF in time intervals defined by an external switching.

The amplitude of the output corresponds to the analog input value and thus determines the speed of the motor.

In Gate Mode, as opposed to Step Mode, the pulse width and pulse frequency are user-defined.

The allowable parameter values for the external signal are as follows:

- Voltage level: 0V(on); 5V(off). Open collector logic is also an option.
- Minimum pulse width: 50 µsec
- Maximum pulse frequency: 1 kHz
1.4.3.1 Enabling the Gate Mode

In order to enable the Gate Mode, the Z14 pin (see Table 7) should be shorted to the ground. Verify that the B10 pin is not shorted to the ground at the same time.

Once Z14 is shorted to the ground, the driver is in Gate Mode. Conduct now the external switching signal through pin B10 (see also section 1.4.2.1).

1.5 Using the AB1A-3U to Drive LS Motors

Under normal conditions, the LS series of motors should not be operated with command voltage exceeding 3.5V. To allow some margin in cases, which require momentarily use of higher power, the AB1A-3U for the LS series of motors is limited to 5V.

Nanomotion expects that during normal operation, the commanding controller should protect the motor, and assumes that in continuous operation the command will not exceed 3.5V. The protection scheme is as follows: the torque limit at the controller must be set to half of the maximum command voltage (5V), and be limited to 5 seconds. The controller RMS torque limit must be set to 35% of the full command.
2 Connections and I/O Settings

2.1 Motion Controller Connection

There are two options of connecting a motion controller to the AB1A-3U driver:

- Differential connection (see Figure 3)
- Single-Ended Connection (see Figure 4)

The differential connection enhances noise immunity.

![Figure 3: Differential Analog Input Connection](image)

![Figure 4: Non-Differential (single ended) Analog Input Connection](image)

2.2 Cable Connections
Connect the following groups of cables together, isolating each of the signals:

- **POWER SUPPLIES** – use 22 AWG (or lower AWG) wires for the power supplies. For noisy surroundings, it is recommended to twist the ground line and the power line together.

- **ANALOG COMMAND** – a twisted shielded cable is recommended.

- **DISCRETE INPUTS** – These signals are not sensitive to noise and can be grouped together in the same harness with any of the other groups.

### 2.2.1 Shielding

As the high motor voltage is induced on the cable shield, it is required to ground the shield on both motor and driver sides to the infrastructure earth.
2.3 Motor Connections

The “Motor Disconnect” signal is available only at the motor (or branch cable) connector, where it is shorted to ground. This ensures that unprotected motor pins will not be exposed to high voltage when the motor is not connected.

If more than one motor is connected to the AB1A-3U Driver Box, use a suitable branch cable or extension cable, as supplied by Nanomotion.

If the motor type or the number of motor elements is changed, consult Nanomotion for the appropriate LC Card configuration and other driver configuration changes that may be required.

![Figure 5: J1 Connection to a Motor or Branch Cable](image)

**Figure 5: J1 Connection to a Motor or Branch Cable**
2.3.1 Motor Cable Length

The overall length of the cables that connect the AB1A-3U driver to the motor elements should be in accordance with the following:

- Up to 2 motor elements – 5m
- 4 – 32 motor elements – 10m

**NOTE:**

Use Nanomotion standard cables. Branching is possible to 2 and 4 identical motors. Branch cables must be of identical length, the sum of which not exceeding the allowed total cable length.

**NOTE:**

Nanomotion can guarantee proper driver and motor performance only when Nanomotion standard cables are used.
2.4 Opto-isolated Inputs

The following inputs are opto-isolated and are activated by shorting them to ground (see also Table 7):

- Powering Up/Down
  - Motor Connected: Safety input. The motor operation is enabled only when this input is shorted to the ground.
  - Enable: Enables the motor activation
  - Emergency Stop (ES): Disables the AB1A-3U output

- Mode Enabling
  - Step Mode: Enables Step Mode operation

- Direction Restrictions
  - Left Switch: Disables motor motion to the left
  - Right Switch: Disables motor motion to the right

2.4.1 Voltage Source Configuration

The opto-isolated input signals are activated as short-to-ground. The voltage for the opto-isolated circuit (see Figure 7) is provided by either the internal +3.3V supply (default setting) or an external voltage supply via pin 20 on the I/O Port connector. The input to be activated should be shorted to external voltage supply ground.

Configure jumper JP 2 (located near LC card) on the AB1A-3U card according to the voltage source:

- Pin 1 shorted to Pin 2, for an internal +3.3V source (factory setting)
- Pin 2 shorted to Pin 3, for an external voltage source

**ATTENTION:** Do not short Pin 1 to Pin 3 on JP2. Doing so shorts the external power supply to the +3.3V supply! The input circuit is limited to sink up to 10 mA but not less than 3 mA.
**Internal voltage source**     **External voltage source**

![Diagram of Jumper 2 Configuration](image)

**Figure 6: Jumper 2 Configuration**

![Diagram of Opto-Isolated Input Interface](image)

**Figure 7: Opto-Isolated Input Interface**
2.5 Fault Output

Fault: An open collector logic output that is active shorted to ground under the following conditions:

- Over Current
- The motor is not connected and the “Motor Disconnect” signal is floating
- Emergency Stop

**NOTE:**

*The Fault output is capable of sinking a maximum of 20 mA, and is not protected from over current.*

2.6 LED Indicators

There are five LED indicators located on the front side of the card. See Figure 8 for LEDs' locations.

- **Power ON.** Green LED. Lights when 48V is applied
- **Fault.** Red LED. Lights when over current protection is triggered.
- **Motor Disabled.** Red LED. Lights when motor is connected and the driver is disabled.
- **Motor Not Connected (NC).** Red LED. Lights when motor is not connected.
- **Motor Enabled.** Green LED. Lights when drive is enabled.
2.7 Before Operating the Motor

Before operating the AB1A-3U, verify the following:

- Card configuration (as specified on card) matches the motor to be operated,
- Jumper JP2 is set to the required mode of operation.
- The external power supply is capable of supplying the required power consumption of the AB1A-3U.
- There is no command when switching the power to “ON”.
- Make sure that all motors that are to be driven by the AB1A-3U are preloaded.

**ATTENTION:** The command should be limited according to the envelope of performance of the motor. Refer to the Motor User Manual.
3 Thermal Envelope of Performance (EOP)

3.1 Description

Motor operating temperature is a result of the balance between heat generation and heat dissipation.

- The heat generation depends on motor's work regime (driver command level).
- The heat is dissipated through the following heat transfer mechanisms: conduction, radiation and convection (the convection mechanism is negligible in vacuum environment).

The heat dissipation mechanisms should be able to dissipate the heat generated in order to avoid overheating. The EOP gives the user the tools to assess the permitted operating conditions (for set ambient temperature and command, deriving the duty cycle and maximal continuous operation that assures safe operation).

The user can either operate the motor for an extended period of time at a specific duty cycle or alternatively, can operate the motor for a continuous time period specified under "Maximal Continuous Operation Time" (see graph and table in section 3.3). After the continuous operation is completed, the driver must be disabled to cool down the motor for 400 sec in air and for 700 sec in vacuum environment.

Notes:

- The duty cycle is the ratio of the operation time and the total work cycle (operation time + idle time).
- Upon operating a motion system in vacuum, it is expected that the Coefficient of Friction of the bearing structure will increase. This may require changing the system operation point on the thermal EOP curves.
3.2 Stage Heat Dissipation Consideration

The motor heat dissipation mechanism is by convection and radiation to the motor case, and by conduction through motor’s ‘finger tips’. Hence, the motor and the Ceramic Driving Strip bases, must both be thermally designed to dissipate 2W each (per motor’s ‘finger tip’), with maximum temperature rise of 15°C.

3.3 Thermal EOP for HR Motor Driven by AB1A, AB1A-3U, AB2 AB4 Drivers

Figure 9 illustrates motor velocity as a function of the applied driver command voltage. Allowing up to 30 mm/sec variations, use it as a reference and as a guideline for expected motor performance:

![Figure 9: Motor Velocity vs. Command](image)

Figure 10 and Table 1 are designed to help the user determining the correct envelope of performance and avoid overheating and damaging the motor.

---

1 The motor operates horizontally at room temperature and low duty cycle (< 10%). It interfaces with the Ceramic Driving Strip (according to Nanomotion Specifications) and a cross-roller high quality slide.
**Figure 10: Motor Force vs. Velocity at the Various Work Regimes (a-g)**
